

**SUPERVALU's Development of
Next Generation Refrigeration
Systems:**

**Application of Ammonia, CO₂ and
Propane**

June 12, 2012

Introductions

Richard Heath
SUPERVALU

Director of Energy Innovations & Projects

Jim Armer, P.E.
CTA Architects Engineers
Refrigeration Group Manager

Refrigeration Partners:

Agenda

1. Project Goals
2. Project Overview
3. Efficiency & Cost Considerations
4. Lessons Learned
5. Future Steps

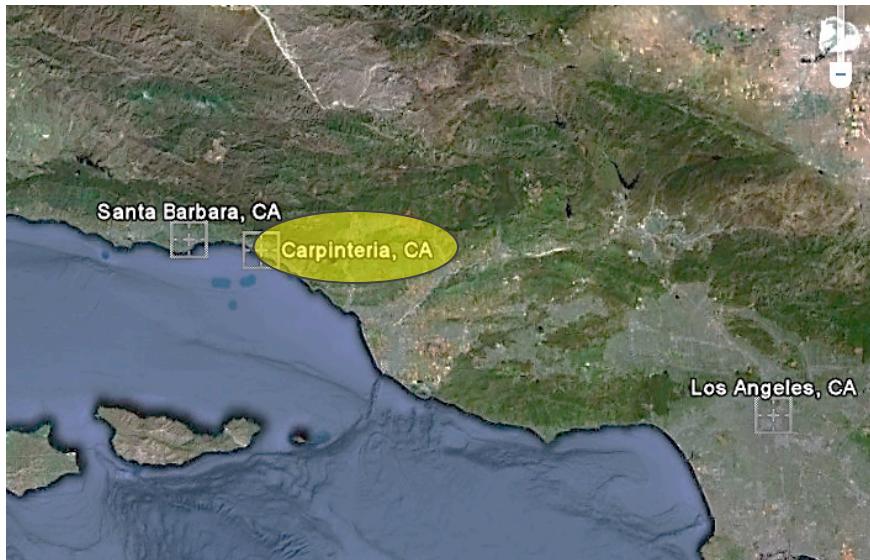

Project Goals

1. Develop a 100% natural refrigerant option for the refrigeration system
2. Determine the cost and value of attaining the 100% option
3. Compare the environmental impact of different refrigeration systems on-site

Project Overview

Project Location:

- Carpinteria, CA
- 85 miles northwest of Los Angeles
- Environmentally aware

Project Overview

Store Design Highlights:

- Remodel-Expansion (20k ft² to 40k ft²)
- Timeline:
 - Design: July 2011
 - Construction: Dec. 2011 – July 2012
- Daylight harvesting
- Dimmable LED lighting technology

Project Overview

Refrigeration System Design Highlights:

- Medium temperature door cases
- R290 (Propane) spot display case
- Water-cooled
- 100% & 90% natural refrigerant options installed

Project Overview

NH₃ Primary
(100% Option)

R407A Primary
(90% Option)

System
Comparison

Project Overview

Refrigeration Design Approach:

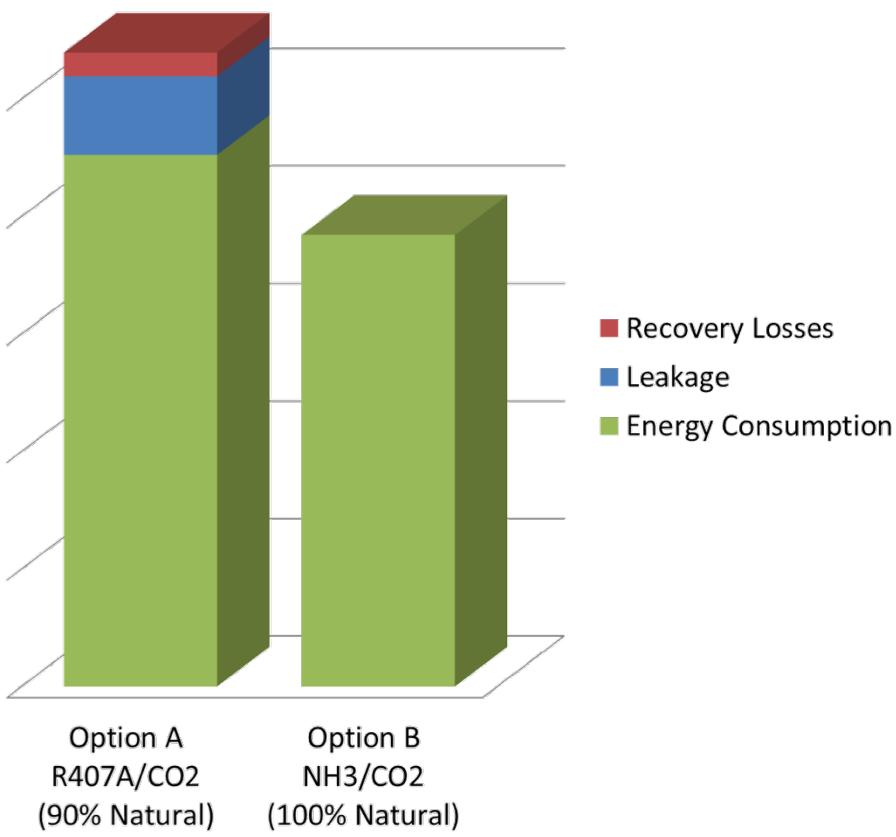

- Efficiency & proven technology
- Refrigerants chosen: NH₃, CO₂, R290, and R407A
- Code compliance research (NH₃, R290)
- System Comparisons:
 - R407A/CO₂ vs. NH₃/CO₂

Environmental Impact Evaluation:

- Total Equivalent Warming Impact (TEWI)
 - Leakage, recovery losses & energy consumption
 - GWP R407A = 2107
 - GWP CO₂ = 1
 - GWP NH₃ = 0

Efficiency & Cost

Total Equivalent Warming Impact (TEWI)

Summary:

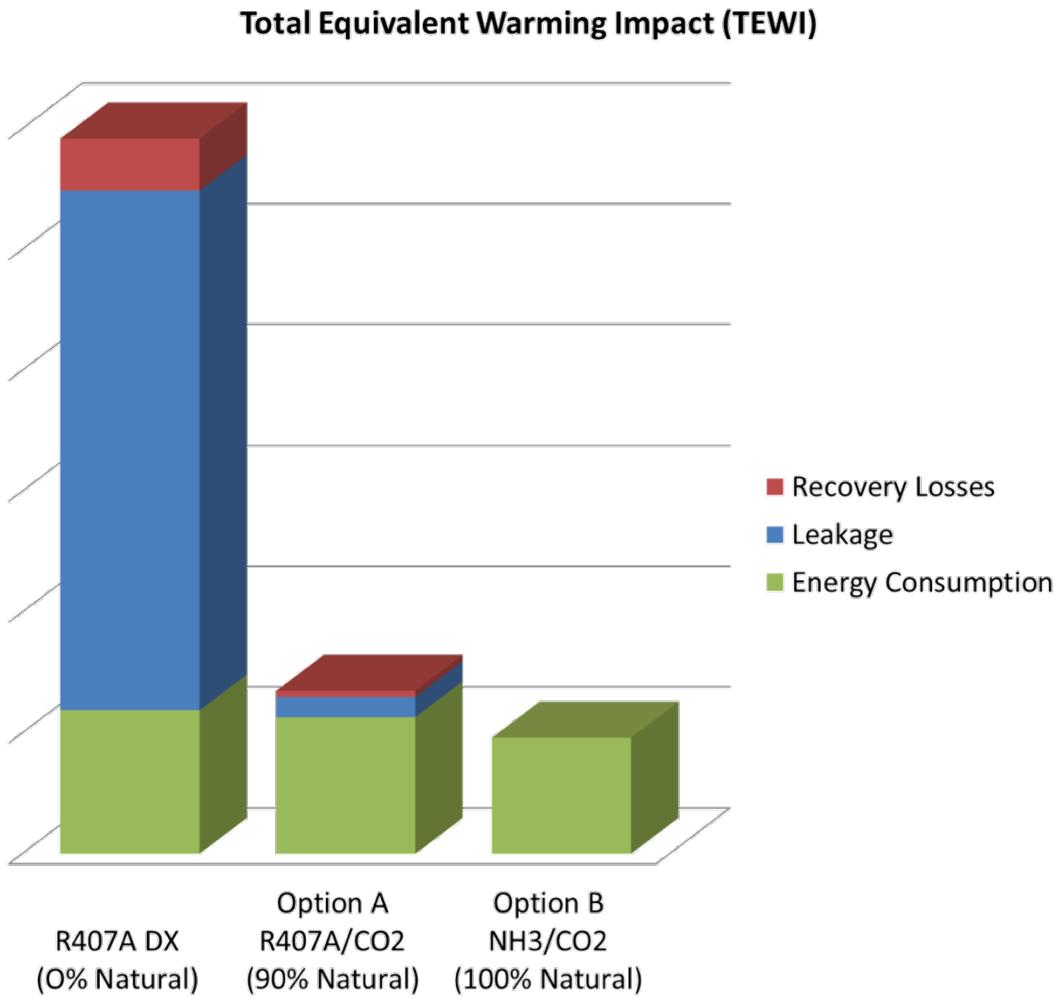

Environmental Impact of NH₃/CO₂ vs.
R407A/CO₂

- 29% TEWI reduction
- 15% Compressor energy savings

Costs of NH₃/CO₂ vs. R407A/CO₂

- 18% First cost increase
- 35% Life cycle cost increase
 - First, Installation,
Maintenance

Efficiency & Cost

Summary:

TEWI reduction compared to R407A DX

- 77% (R407A/CO₂)
- 84% (NH₃/CO₂)

Life cycle cost increase compared to R407A DX

- 14% (R407A/CO₂)
- 55% (NH₃/CO₂)

Lessons Learned

Cost solutions:

- Increase volume
- Reduce redundancy
- Use proven technology
- Reduce loads

NH₃ regulatory concern solutions:

- Understand charge threshold & safety
- Engage local authorities
- Educate, educate, educate

Qualified contracting & maintenance solutions:

- Increase volume
- Leverage experience
- Provide training

Future Steps

Develop a white paper on Albertsons Carpinteria showing actual TEWI results from tests

CO₂ is the future of distributed refrigeration in the supermarket

- Evaluating further the value proposition of attaining 100% through this solution or an alternative

Optimization of the 90% solution

- Actively designing retrofits for CO₂ in remodels
